

END-TO-END DATA PROCESSING & VISUALIZATION

using Python

Case Study About E-Commerce User Behavior Analysis

A Project by **Rakha Raihan Raditya**

01

BUSINESS CONTEXT & OBJECTIVES

Role

Associate **Data Analyst**

Company: BukaToko

E-commerce platform operating across Southeast Asia, US, and Australia.

Goal

- Explore **user behavior**
- Provide **data-driven insights** to optimize Marketing Strategy

OBJECTIVES

1

Market Identification

Identify the country with the **highest user activity** in Q2 2025

2

Growth Trend Analysis

Analyze **Monthly Active User** trends across different acquisition channels

3

Device Preference

Determine which device is **most frequently used** by customers

4

Feature Effectiveness

Evaluate the "**Search-to-Cart**" **conversion rate** to measure search feature performance

5

Peak Activity Analysis

Identify the **busiest days and hours** to optimize engagement timing

DATA PREPARATION & QUALITY CHECK

```
import pandas as pd
import numpy as np

spreadsheet_url = "https://docs.google.com/spreadsheets/d/1dDczkp5SRp6IMNpKxiak_4q0S5qr0SILiYKzp-2I9ZE/export?format=csv&gid=1307725687"
df = pd.read_csv(spreadsheet_url)

df.head()
```

	event_id	user_id	session_id	event_type	event_timestamp	product_id	country	device	channel
0	9bd8725f-5722-41b7-8d95-a5dafec33a56	482c0ae4-ac6c-4eb3-91fe-b0e63c1c2a5d	98b232db-5bec-41d8-88e1-5d2e98899e29	product_view	2025-09-22 16:35:27	P1208	US	IOS	paid_search

[Click here to view dataset](#)

```
df.info()

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10000 entries, 0 to 9999
Data columns (total 9 columns):
#   Column                Non-Null Count  Dtype
---  -
0   event_id              10000 non-null  object
1   user_id               10000 non-null  object
2   session_id            10000 non-null  object
3   event_type            10000 non-null  object
4   event_timestamp       10000 non-null  object
5   product_id            4463 non-null   object
6   country               10000 non-null  object
7   device                10000 non-null  object
8   channel               9900 non-null   object
dtypes: object(9)
```

event_timestamp was stored as an object (string)

Detected Null values in the channel column.

ACTION

Converted column to datetime format

```
df["event_timestamp"] = pd.to_datetime(df["event_timestamp"])
```

```
df["date"] = df["event_timestamp"].dt.date
```

Extracted the date component to a new column

```
df["channel"] = df["channel"].fillna("organic")
```

Imputed missing values with "organic" (assuming direct traffic)

AFTER

```
df.info()

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10000 entries, 0 to 9999
Data columns (total 10 columns):
#   Column                Non-Null Count  Dtype
---  -
0   event_id              10000 non-null  object
1   user_id               10000 non-null  object
2   session_id            10000 non-null  object
3   event_type            10000 non-null  object
4   event_timestamp       10000 non-null  datetime64[ns] ✓
5   product_id            4463 non-null   object
6   country               10000 non-null  object
7   device                10000 non-null  object
8   channel               ✓10000 non-null  object
9   date                  ✓10000 non-null  object
dtypes: datetime64[ns](1), object(9)
```

Feature Effectiveness

Evaluate the "Search-to-Cart" conversion rate to measure search feature performance

event_type
product_view
page_view
page_view
page_view
product_view
purchase
product_view
login
page_view
checkout
search
page_view
add_to_cart
add_to_cart

In the raw dataset, **search** and **add_to_cart** are recorded as separate rows.

We must strictly identify users who performed *both* actions **on the same calendar date**.

```
search_data = df[df['event_type'] == 'search'][['user_id', 'date']].drop_duplicates()
```

```
atc_data = df[df['event_type'] == 'add_to_cart'][['user_id', 'date']].drop_duplicates()
```

```
converted_data = pd.merge(search_data, atc_data, on=['user_id', 'date'], how='inner')
```

03

ANALYTICAL LOGIC: SEARCH-TO-CART ATTRIBUTION

Step 1: Isolate & De-duplicate

Separate 'Search' and 'ATC' events and remove **duplicates**.

Step 2: 'Same Day' Logic

Use **Inner Join** to find users matching both actions **on the same date**

04

OBJECTIVE #1: MARKET IDENTIFICATION

THE CODE

```
df['month_name'] = df['event_timestamp'].dt.month_name()
q2_months = ['April', 'May', 'June']
df_q2 = df[df['month_name'].isin(q2_months)]
top_country = df_q2.groupby('country')['user_id'].nunique().sort_values(ascending=False)
```

Converted column to **datetime format**

Isolating data strictly for the requested period (**April-June**)

Filters dataset to include only **q2_months**

Groups data by country

Counts distinct users (avoids double-counting the same person)

Ranks results **from highest to lowest** activity

**Q2 MARKET
FOCUS:
INDONESIA
LEADS IN
USER
ACTIVITY**

Indonesia (ID) is the most active market with **1,055** users, significantly outperforming the **US (815)** and **Vietnam (485)**

CHANNEL PERFORMANCE OVERVIEW

Analysis reveals that recorded data is available from **March to September** 2025. A coordinated increase **occurred in April** across all channels, followed by stability until August, with a **significant decline beginning in September**.

05

OBJECTIVE #2: GROWTH TREND

```
channel_trend = df.pivot_table(
    index='month_name',
    columns='channel',
    values='user_id',
    aggfunc='nunique'
)
```

Reshapes data for **multi-line comparison**

Ensures accuracy by **counting unique users**

```
months_order = ['January', 'February', 'March', 'April', 'May', 'June', 'July',
                'August', 'September', 'October', 'November', 'December']
```

```
channel_trend = channel_trend.reindex(months_order)
```

Fixes sorting to **chronological order**
(Prevents April → August)

```
channel_trend = channel_trend.dropna(how='all')
```

Delete rows where the **entire month is NaN**

```
display(channel_trend)
```

Table

channel	direct	email	organic	paid_search	referral	social
month_name						
March	41.0	33.0	36.0	38.0	50.0	40.0
April	262.0	258.0	274.0	255.0	244.0	276.0
May	270.0	284.0	264.0	259.0	244.0	268.0
June	271.0	263.0	273.0	258.0	289.0	262.0
July	257.0	290.0	281.0	288.0	255.0	250.0
August	250.0	248.0	267.0	251.0	292.0	240.0
September	186.0	209.0	225.0	206.0	197.0	174.0

OBJECTIVE #3: DEVICE PREFERENCE

```
users_per_device = df.groupby('device')['session_id'].nunique().sort_values(ascending=False)
```

Categorizing interactions to identify the dominant platform used by customers.

MOBILE-FIRST BEHAVIOR

The majority of access comes from **Android & iOS**, indicating a strong dependency on mobile apps **compared to Desktop/Web**

```
display(users_per_device)
```

session_id	
device	
android	4961
ios	4000
desktop	1039

07

OBJECTIVE #4 FEATURE EFFECTIVENESS

Applying the "Search-to-Cart Attribution Logic" established in the Methodology section (Point 03), now we quantify the actual conversion performance.

```
total_searchers = len(search_data)
total_converted = len(converted_data)
```

→ Extracting User Counts

```
conversion_rate = (total_converted / total_searchers) * 100
```

→ Conversion formula

Converted Data Table

	user_id	date
0	4074cba6-8de9-4660-b191-e08fc7bf6dc2	2025-05-13
1	3bd58b47-09d8-473d-ac36-19578b89edfb	2025-08-07

The 0.21% Conversion Challenge

The conversion rate is **critically low**. This confirms that while users utilize the Search feature, immediate **intent to purchase** is **almost non-existent**.

OUR MONETIZATION STRATEGY—
SUSTAINABLE, SCALABLE, AND
SMART.

OPTIMIZATION
WINDOW

User activity is well-distributed, but **Peak Engagement Windows** are identified during **commuter hours (7-8 AM & 5-7 PM)**.

08

OBJECTIVE #5:
ACTIVITY ANALYSIS

```
df['hour'] = df['event_timestamp'].dt.hour
df['day_of_week'] = df['event_timestamp'].dt.day_name()

Extracts time components (Hour & Day)

day_order = ['Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday', 'Sunday']
df['day_of_week'] = pd.Categorical(df['day_of_week'], categories=day_order, ordered=True)

Enforces chronological sorting (Mon -> Sun) to prevent default alphabetical ordering

activity = df.groupby(['day_of_week', 'hour'])['user_id'].nunique().unstack(fill_value=0)

Transforms data into a matrix format (Rows=Days, Cols=Hours)
```

display(activity)

hour	0	1	2	3	4	5	6	7	8	9	...	14	15	16	17	18	19	20	21	22	23		
day_of_week																							
Monday	60	57	61	75	57	73	66	78	54	52	...	54	60	64	58	51	48	47	69	50	59		
Tuesday	58	65	66	63	47	57	64	56	61	61	...	54	61	56	64	58	48	39	61	57	64		
Wednesday	51	48	56	64	62	48	60	63	63	50	...	53	60	49	52	70	68	61	57	52	66		
Thursday	50	59	61	45	60	51	62	53	52	54	...	56	59	64	62	62	58	54	55	50	64		
Friday	47	70	66	56	61	56	64	49	53	56	...	59	50	55	56	65	55	53	52	58	67		
Saturday	60	61	65	72	58	60	56	77	57	58	...	51	54	53	70	48	52	75	56	58	56		
Sunday	77	57	67	57	56	61	57	64	65	68	...	55	42	62	58	52	62	67	55	65	64		

7 rows × 24 columns

STRATEGIC ROADMAP: 3 KEY PILLARS

1

Indonesia dominates traffic, and users are heavily mobile-centric

Allocate Q3 engineering resources to optimize Mobile App performance specifically for the Indonesian region. Adopt a "Mobile-First" design for all new features.

2

Search-to-Cart conversion is critically low (0.21%)

Audit the search algorithm relevancy and pricing competitiveness. Conduct A/B testing on the search result page (UI/UX) to reduce drop-off.

3

Commuter hours (7-8 AM & 5-7 PM) are peak times, but a seasonal slump is predicted for September

Schedule push notifications during commuter windows. Launch a "September Super Sale" or loyalty campaign in late August to prevent the projected traffic decline
